

WHY DO I NEED A FULL FACE MASK?

Many patients receiving positive airway pressure therapy breathe through their mouths. Air leaking from the mouth during treatment may compromise therapy. The Mirage Full Face Mask Series 2 is more suitable than a nasal mask in this situation as it allows delivery of the treatment pressure through your nose and/or mouth.

COMFORT AND PERFORMANCE

The comfort and performance of the Mirage Full Face Mask Series 2 has been optimized with the following design features:

- A double layer, contoured cushion, when inflated by air pressure, gently floats on the face eliminating the need for tight headgear while still providing a secure seal. Because the cushion is contoured to the nose, only the soft membrane touches the sensitive nose bridge.
- A forehead stability arm improves seal.
- Circular headgear design cups the crown of the head for added support.
- New Breath-O-Prene™ headgear material draws moisture away from the skin and allows air to circulate.

DURABILITY AND EASE OF USE

The Mirage Full Face Mask Series 2 is designed to be long lasting and easy to use. Durability has been further improved with the introduction of the new Breath-O-Prene headgear material, which has Velcro™ tabs welded to the headgear straps for extra strength and easy adjustment. The frame's elbow clips have been designed for superior strength.

The Mirage Full Face Mask Series 2 system has a complete range of replacement parts.

▼ The unique five point headgear enhances fit and stability

▲ Circular headgear cups the crown of the head

Breath-O-Prene draws moisture away from the skin ▲

SAFETY

The Mirage Full Face Mask Series 2 is hypo-allergenic and contains no latex or neoprene.

The Mirage Full Face Mask Series 2 has a valve that automatically opens if the flow generator ceases operation (eg, during a power failure) enabling you to breathe room air while still wearing the mask. A Quick Release Tab can be pulled to release the headgear and mask in case of an emergency.

I still have some questions ...
